

FLEXIBLE METAL HOSE ASSEMBLIES

Introduction

With origins dating to 1902, Senior Flexonics is today recognized as the leader in the metal hose industry. Our leadership has been earned through consistent application of solid engineering principles, stringent quality standards and product innovation to produce safe and reliable metal hose assemblies for various industrial piping applications.

This catalogue contains product performance data and physical descriptions for each of our series of metal hose. In addition, applications engineering information is included to provide guidance in the selection and installation of metal hose assemblies in your piping system . Hopefully, you will find this catalogue to be a useful and informative technical reference manual that assists you in making an educated selection of the most suitable products for your application.

Quality Programs and Certifications

- ISO Certification: As part of our continual business improvement process, Senior Flexonics quality assurance system is certified to ISO 9001:2000.
- Welding: All welding is performed by certified welders to ASME Section IX of the Boiler and Pressure Vessel Code.
- Testing: All hose assemblies are 100% tested prior to shipment. Standard tests include hydrostatic and pneumatic. Other tests are available upon request. Test reports are supplied with shipment upon request.
- Tagging: All assemblies are tagged with CRN number and any other information required.

NOTICE: The information and technical data contained herein is believed to be accurate and the best information available to us at the time of printing this catalogue. All information and data contained herein is subject to change at any time, without notice. Because we have no control over the selection, installation or use of our products, we cannot be responsible for their improper application or misuse.

Senior Flexonics Ltd., Warranty

Senior Flexonics Ltd., warrants that products furnished will, at the time of shipment, be free from defects in material and workmanship under normal use and service.

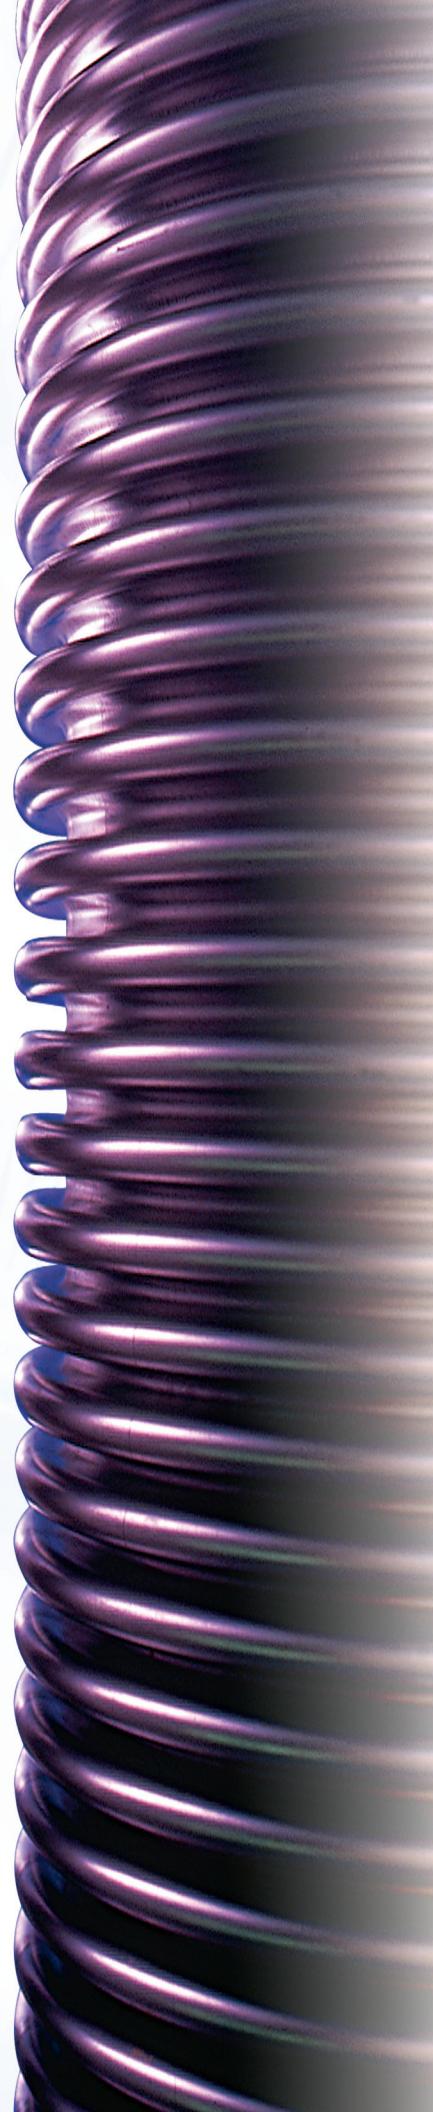

Senior Flexonics Ltd., will repair or replace any product in which defects occur within one (1) year from the date of installation or eighteen (18) months from the date of shipment, whichever occurs first. Purchaser shall be responsible for proper installation of the products purchased and that the products purchased are operating within the design limits of each unit.

Senior Flexonics Ltd., makes no other warranty, express or implied, of merchantability and no other warranty, express or implied, of fitness for a particular purpose which extends beyond those warranties above. In no event shall Senior Flexonics Ltd., be liable for consequential or incidental damages. Liability shall not exceed the unit value of the item supplied.

FLEXIBLE METAL HOSE APPLICATION

DESIGN AND APPLICATION GUIDE

The selection of the correct metal hose is critical to insure optimum field performance. To accomplish this, there are a number of important applications requirements that must be known. The guide below will help you identify the requirements, and design the most cost effective, engineering sound product. The word "STAMPED" is useful as a checklist of applications requirements to be considered.

| Consider | check for | Refer to |
|----------------------------|---|---|
| S size/Hose & Fittings | <ul style="list-style-type: none">Size of existing piping and mating fittings.Flow requirements. | <ul style="list-style-type: none">"Hose Technical Data" pages |
| T emperature | <ul style="list-style-type: none">Maximum service temperature of the application.Maximum allowable service temperature rating for hose and fitting alloys.Reduced operating pressures at elevated temperatures. | <ul style="list-style-type: none">"Metal Hose Selection Factors" pages for maximum service temperature for alloys and conversion factors |

NOTICE: This Engineering Guide is to assist you in the selection and application of flexible metal hose for your particular requirements. The information and data contained in this Engineering Guide are the result of years of our experience and research in flexible metal hose. As such it is the best information and data available to us as of the date of printing. Progress is part of any dynamic program of research and development, such as the company sponsors, so that all information and data contained herein are subject to change (without notice) at any time.

Should you be unable to determine a specification for a particular application, we solicit receiving details describing the application so that we may make a recommendation. Because we do not supervise or control the installation and use our products, we cannot be responsible for their performance or the improper application and usage of the data.

[STANDARD PRESSURE HOSE]

SERIES 100/160 STAINLESS STEEL HOSE

Construction: T-321 and T-316L Annular Standard Pitch Stainless Steel Hose, Series 300 Stainless Steel Braid

Size Range: 1/4" through 30"

Pressure Ratings: Full vacuum to pressures indicated below.

Temperature Range: Cryogenic to 1250 °F.

- Series 100 & 160 Unbraided

- Series 101 & 161 Single Braided

- Series 102 & 162 Double Braided

—[HIGH PRESSURE HOSE]—

SERIES 700 STAINLESS STEEL HOSE

Construction: Annular Close Pitch T-316L Heavy Weight Stainless Steel Hose, Series 300 Stainless Steel Braid

Size Range: 1/4" through 12"

Pressure Ratings: Full vacuum to pressures indicated below.

Temperature Range: Cryogenic to 1500 °F.

- Series 700 Unbraided

- Series 701 & Single Braided

- Series 702 Double Braided

| Nominal Hose Size (in.) | Hose Series | Nominal Outside Diameter | Minimal Centerline Bend Radius (in.) | | Pressure Ratings at 70°F (PSIG) | | | Weight Per Foot (lb.) |

[ULTRA HIGH PRESSURE HOSE]

SERIES 750 STAINLESS STEEL HOSE

Construction: Helical Close Pitch T-316L Stainless Steel Hose, Series 300 Stainless Steel Double Braided

Size Range: 1/4" and 1/2"

Pressure Ratings: Full vacuum to pressures indicated below.

Temperature Range: Cryogenic to 1500 °F.

- Series 752 Double Braided

| Nominal Hose Size (in.) | Hose Series | Nominal Outside Diameter | Minimal Centerline Bend Radius (in.) | | Pressure Ratings at 70°F (PSIG) | | | Weight Per Foot (lb.) |
|-------------------------|-------------|--------------------------|--------------------------------------|---------|---------------------------------|-----------|---------------|-----------------------|

Senior Flexonics Series 500 Monel® hose and braid is specifically designed for chlorine transfer as well as hydrochloric and hydrofluoric acid applications. The hose and braid combination meets and exceeds the Chlorine Institute's Pamphlet 6 specification, "Recommended Specifications for Chlorine Transfer Hose". Our series 500 hose and braid combination is particularly effective in the harsh seawater environment of ocean going vessels and offshore drilling platforms, where reliable performance is needed every day. Use Senior Flexonics 500 series for dependable and safe chlorine transfer.

—[SPECIALTY HOSE]—

SERIES 600 INCONEL® HOSE

Construction: Annular Standard Pitch Inconel® 625 Hose and T-321 Braid (Inconel Braid also available)

Size Range: 1/4" through 2"

Pressure Ratings: Full vacuum to pressures indicated below.

Temperature Range: Cryogenic to 1500 °F with T-321 Braid/1800 °F. with Inconel Braid

- Series 600 Unbraided

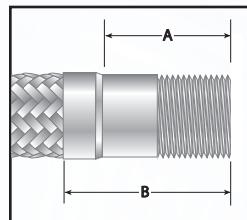

- Series 601 Single Braided

| Nominal Hose Size (in.) | Hose Series | Nominal Outside Diameter | Minimal Centerline Bend Radius (in.) | | Pressure Ratings at 70°F (PSIG) | | | Weight Per Foot (lb.) |

Senior Flexonics Series 600 Inconel® 625 annular corrugated hose with available Inconel® 625 braid or standard T321 stainless steel braid offers superior corrosion resistance. As a low temperature corrosion resistant material, 625 alloy has an excellent record in use in the chemical processing industry, in sea and brackish water and in power plant scrubber applications. It resists chloride pitting and crevice corrosion as well as chloride stress-corrosion cracking.

METAL HOSE SELECTION FACTORS

1. PRESSURE

Senior Flexonics pressure ratings are in accordance with industry-wide good practice and are consistent with the requirements of the Standard Code for Pressure Piping and the ASME Boiler and Pressure Vessel Code, Sec. VIII.

MAXIMUM WORKING PRESSURE:

Maximum operating pressure to which the hose should be subjected. It is established at 25% of the Nominal Design Burst Pressure. The hose may be deflected within the specified bend radius range.

MAXIMUM PROOF PRESSURE:

Maximum test pressure to which the hose should be subjected. It is established at 150% of the Maximum Working Pressure with the hose installed straight. No harmful deformation shall occur.

Hydrostatic field tests of hose assemblies installed in varying degrees of radial bend or parallel offset should be limited to 120% of the maximum rated working pressure at 70°F, or 150% of the actual operating pressure, whichever is lower.

NOMINAL DESIGN BURST PRESSURE:

The pressure at which the hose can be expected to rupture, based on the minimum annealed ultimate tensile strength of the braid wire and corrugated hose alloys at 70°F and the hose installed straight.

PULSATING OR SHOCK PRESSURE:

When pulsating, surge or shock pressures exist, such as occur due to fast closing valves, the peak pressure shall not exceed 50% of the Maximum Working Pressure. Installation shall be such that there is no initial slack in the braid when the pressure pulse, surge or shock occurs.

PRESSURE RELATIVE TO UNBRAIDED HOSE:

At Maximum Working Pressure, 1 to 2.5 % elastic elongation will occur in unbraided hose assemblies. To avoid squirm, unbraided hose should be unrestrained at one end, or installed in such a manner as to allow free axial expansion due to pressure, as in a 180° loop.

PRESSURE RELATIVE TO BRAIDED HOSE:

Whenever appreciable internal pressure is applied to a corrugated metal hose, it will elongate unless restrained. Generally this restraint is provided by a wire braid sheath over the hose. The braid has little effect on bending or flexibility of the hose. However, in extremely short lengths of braided and pressurized hose, additional bending forces are required because of braid friction.

Where the strength of the braid sheath is the limiting factor, additional working pressure may be gained by using a heavier than standard single braid, or two or more braids. However, when the hoop rupture strength of corrugated hose is the limiting factor, no additional pressure resistance is gained with additional braids.

Contact Senior Flexonics Engineering for braid/hose design assistance to determine maximum pressure ratings at lowest total cost for an application.

PRESSURE RELATIVE TO TEMPERATURE:

For operating temperatures in excess of 70°F, the tabulated pressures must be decreased in accordance with the "Conversion Factors" (refer to table on page 16). Since the pressure ratings are based on annealed material properties, no reduction in pressure ratings is necessary for fitting attachment by TIG welding, brazing, silver brazing, or soft solder.

II. MAXIMUM SERVICE TEMPERATURE

OF MATERIALS

(Refer to table on page 16)

III. FLOW VELOCITY

1) Where flow velocity exceeds 100ft/sec gas (50ft/sec liquid), in unbraided hose, or 150 ft/sec gas (75ft/sec liquid), in braided hose, a flexible metal liner of fully interlocked (RT) hose should be used. When the hose is installed in a bent condition, these flow values should be reduced by 50% for a 90° bend, 25% for a 45° bend, and so on, proportional to the angle of bend. In cases where velocity exceeds the above values, the next larger size corrugated hose should be used with the flexible RT liner sized equivalent to the mating pipe size.

2) Where the amount of pressure drop through longer lengths of hose is a significant factor, a larger diameter hose may be required. As a broad rule of thumb, pressure drop through a corrugated metal hose is approximately three times that in comparable size standard steel pipe. For more accurate calculations of pressure drop, consult Senior Flexonics Engineering.

METAL HOSE SELECTION FACTORS

Consult Senior Flexonics Engineering whenever service conditions necessitate consideration of the influence of long time exposure at elevated temperature.

Consult Senior Flexonics Engineering whenever service conditions necessitate consideration of the influence of long time exposure at elevated temperature.

METAL HOSE SELECTION FACTORS

IV. MOTION

Most industrial applications can be reduced to one of five classes of motion: (1) Angular (2) Axial; (3) Offset (4) Radial; or (5) Random.

1. Angular Motion: Motion that occurs when one end of a hose assembly is deflected in a simple bend with the ends not remaining parallel. Angular motion may be incorporated in an installation to accommodate misalignment and vibration only, but must not be used to accommodate expansion that would result in unloading the braid.

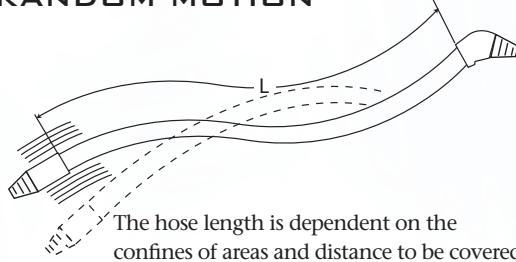

2. Axial Motion: This type of motion occurs when one end of a hose assembly is deflected along its longitudinal axis. Axial motion is applicable to annular corrugated, unbraided flexible hose only. Neither helical hose nor braided hose should be used in axial motion applications.

3. Offset Motion: Motion that occurs when one end of the hose assembly is deflected in a plane perpendicular to the longitudinal axis with the end remaining parallel. Offset is measured in inches of displacement of the free end centerline from the fixed end center line. In offset motion applications, the offset should never be greater than one-fourth (25%) if the minimum center line bend radius.

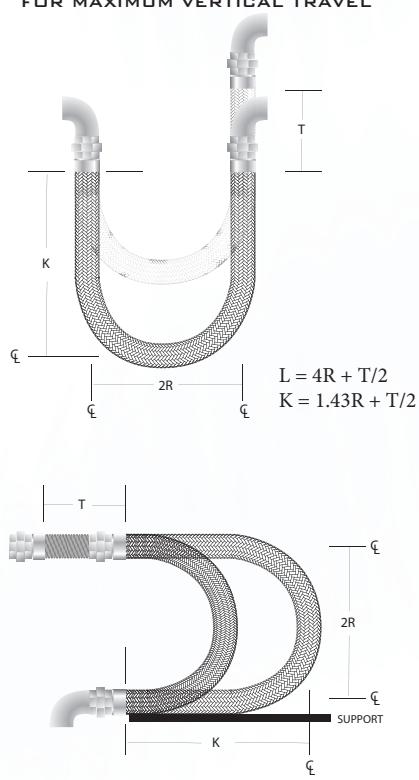

4. Radial Motion: This type of motion occurs when the center line of a hose assembly is bent in a circular arc. In industrial applications, radial motion is most commonly found in travelling loops.

5. Random Motion: Non-predictable motion that occurs from manual handling of a hose assembly. Loading and unloading hose would generally fall into this category. Abusive handling of hose is an important factor to consider in applications involving random motions. The use of an interlocked (RT-6 or RT-8) guard over the corrugated hose is recommended to protect the hose assembly from rough handling and "overbending" adjacent to the end fittings.

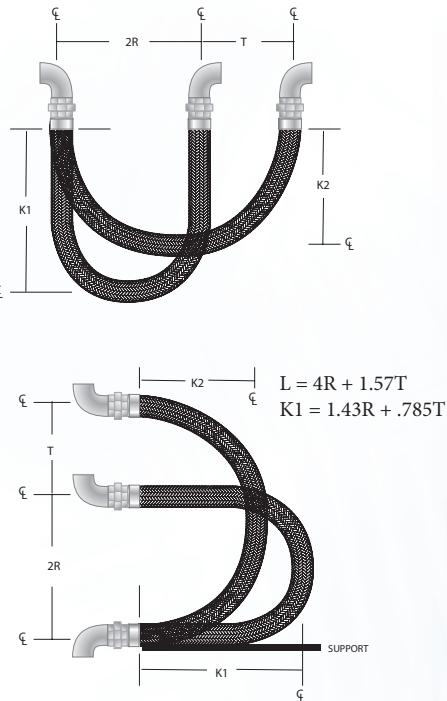

RANDOM MOTION

CLASS A TRAVELING LOOPS FOR MAXIMUM VERTICAL TRAVEL

CLASS B TRAVELING LOOPS FOR SHORT HORIZONTAL TRAVEL

T = Total travel (in.)

R = Center line bend radius (in.)

L = Hose live length (in.)

K = Loop Length (in.)

Note: In loop installations both connections and travel should be in same plane as the bend.

METAL HOSE SELECTION FACTORS

V. MOTION FREQUENCY

The frequency of a particular class of motion to which a flexible metal hose may be subjected by repeated flexing or bending. The frequency of motion may be divided into three basic categories: namely vibration, intermittent, and continuous. The minimum live length required for these motion categories may be selected as follows:

1. Vibration: For the normal vibration encountered in industrial applications, such as pump and compressor discharge lines and engine exhaust installations, the hose live lengths should be taken from the Minimum Live Length For Vibration column on Technical Data Pages.

Normal vibration is shown as the unshaded area of the chart below. If the expected combination of double amplitude (total motion excursion) and frequency falls into the shaded area, consult Senior Flexonics Engineering.

Caution: Avoid hose resonance. If resonance is anticipated, consult Senior Flexonics Engineering.

2. Intermittent motion: Motion that occurs on a regular or irregular cyclic basis normally the result of thermal expansion and contraction or other noncontinuous actions.

The intermittent flexing bend radius shown on Hose Technical Data Pages shall be used in the formulas for angular, radial and offset motion when determining hose live length for intermittent motion.

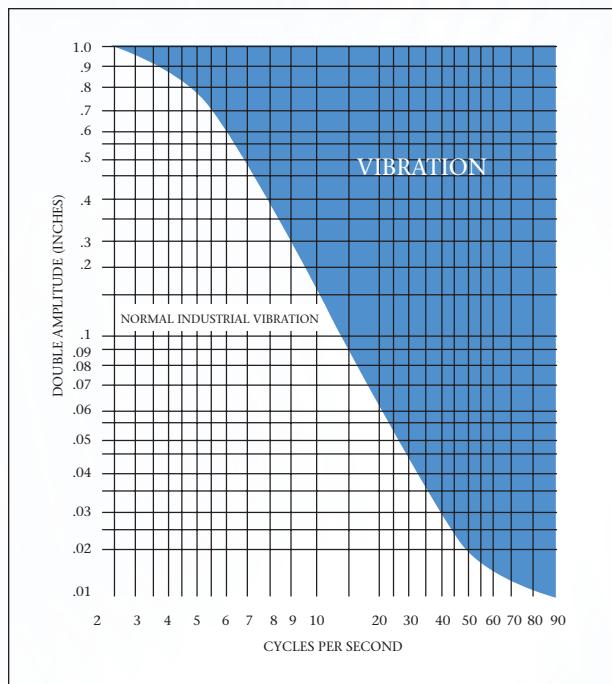

3. Continuous motion: Motion that occurs on a regular cyclic basis normally at a slow cyclic rate and constant travel. For Continuous Lateral Offset Motion double the minimum centerline bend radius required for Intermittent Flexing shown on Hose Technical Data Pages.

4. Static Bend: The minimum center line bend radius to which a flexible metal hose may be bent for installation. No further motion is to be imposed other than normal vibration.

VI. CYCLE LIFE

The cycle life expectancy of a metal hose is affected by various factors such as: operating pressure, operating temperature, materials, bend radius (the movement per corrugation due to the flexure), the thickness of the corrugation, the corrugation pitch, depth, and shape of the corrugation. Any change in one of these factors will result in a change in the cycle life of a metal hose assembly.

The cycle life of a metal hose assembly is proportional to the sum of the pressure stress range and deflection stress range. The life expectancy can be defined as the total number of completed cycles which can be expected from the metal hose

assembly based on S/N curves and data tabulated from tests performed under simulated operating conditions. A cycle is defined as one complete movement from the initial position in the system to some operating point and returning to the original position.

This information should be used as a guide only. We cannot predict every variable which might be encountered in every application nor any misapplication, mechanical damage, and/or any uncontrollable situation.

Please consult Senior Flexonics Engineering for any additional information or cycle life data.

METAL HOSE SELECTION FACTORS

ANGULAR OFFSET MOTION

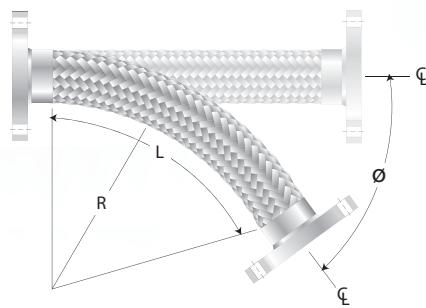

Angular movement is defined as the bending of the hose so that the ends are no longer parallel. Amount of movement is measured in degrees from centerline of the hose if were installed straight.

MINIMUM LIVE LENGTH OF HOSE FOR ANGULAR OFFSET MOTION

Degree of Angular Movement = \emptyset

* Centerline Bend Radius (in.) = R

IMPORTANT NOTE:

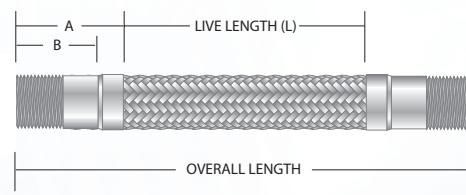

The values shown are minimum live lengths for most centerline bend radii and total offset travel combinations. If the exact radius or travel are not shown on the chart, then the next larger value may be used or use the lateral offset formula. The values as shown in the shaded portion are applicable to static bends only. The offset motion should never be greater than 1/4 (25%) of the centerline bend radius.

Assembly Length (Live Length and Over-all Length)

After the hose is selected for the application, the live length and over-all length of the assembly must be determined to complete the design. The live length is the flexible portion of an assembly and can be determined for the class motion from the motion diagrams and for vibration.

After the live length has been determined, the over-all length is calculated by adding the dimensions for the end fittings. Refer to the Fitting Charts for fitting lengths. Add the "A" dimension for braided hose or the "B" dimension for unbraided hose. Be sure to add fitting lengths for each end.

CORRUGATED METAL HOSE INSTALLATION DATA

INSTALLATION RULES

To obtain maximum service life from metal hose, two IMPORTANT installation rules must be kept in mind:

1) Do Not Torque

A hose is subjected to torque by:

A) Twisting in installation. To minimize possible torque damage to a hose, a union or floating flange should be used at one end of the hose assembly. Where flanges are used, the fixed flange end should be bolted into place before the floating flange end. Where a threaded nipple and a union are used, the nipple end should be threaded into place, and then the union tightened into place using two wrenches.

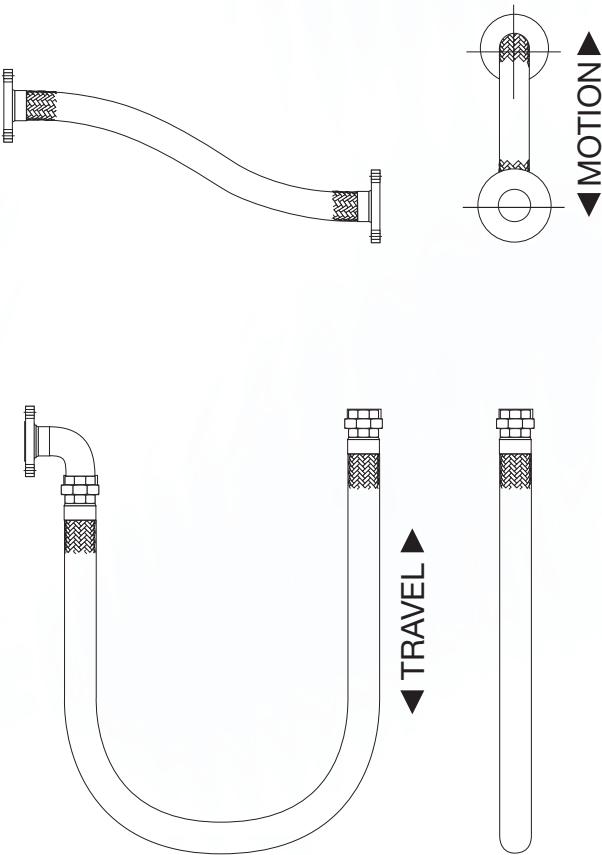

B) Twisting on flexure. Always install the hose so that flexing takes place in one plane only, and in the plane of bending.

2) Avoid Sharp Bends

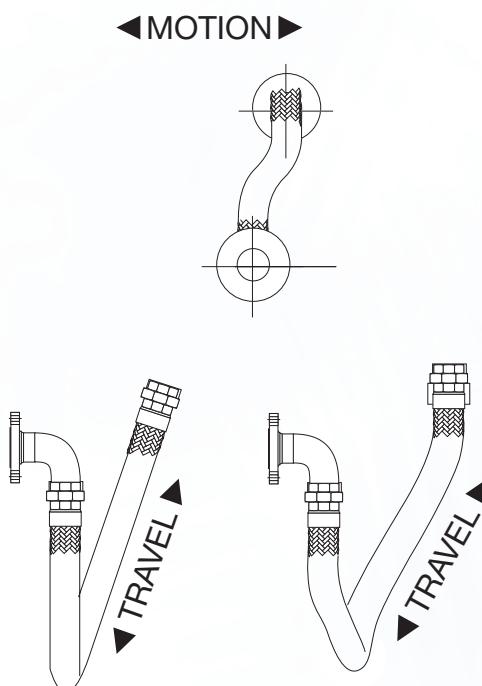

There are many ways a hose can be subjected to recurring sharp bends as a result of improper installation. A few examples are illustrated below. The minimum centerline bend radius for intermittent flexing should never be less than the values specified in the Technical Data Section.

Should piping restrictions make it impractical to install hose in the proper manner, the use of an interlocked hose guard will limit the hose bending to a suitable radius, thus prolonging the life of the corrugated hose.

CORRUGATED METAL HOSE INSTALLATION DATA

RIGHT

WRONG

PIPE ANCHORING AND GUIDING

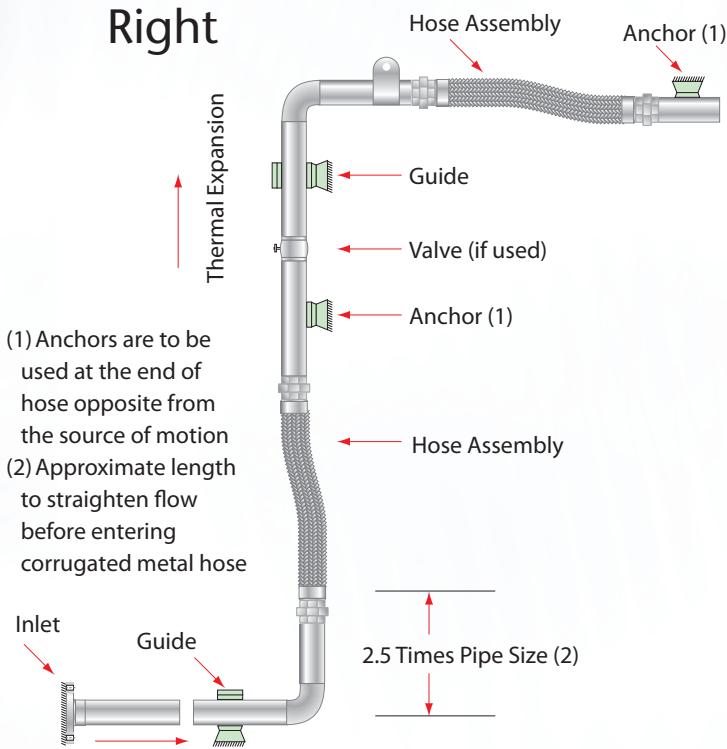

A piping system which utilizes flexible metal hose to absorb pipe movement must be properly anchored and guided to assure correct functioning and maximum service life of the metal hose. The basic principles to be observed are:

- 1) The direction of pipe motion must be perpendicular to the center line (axis) of the hose.

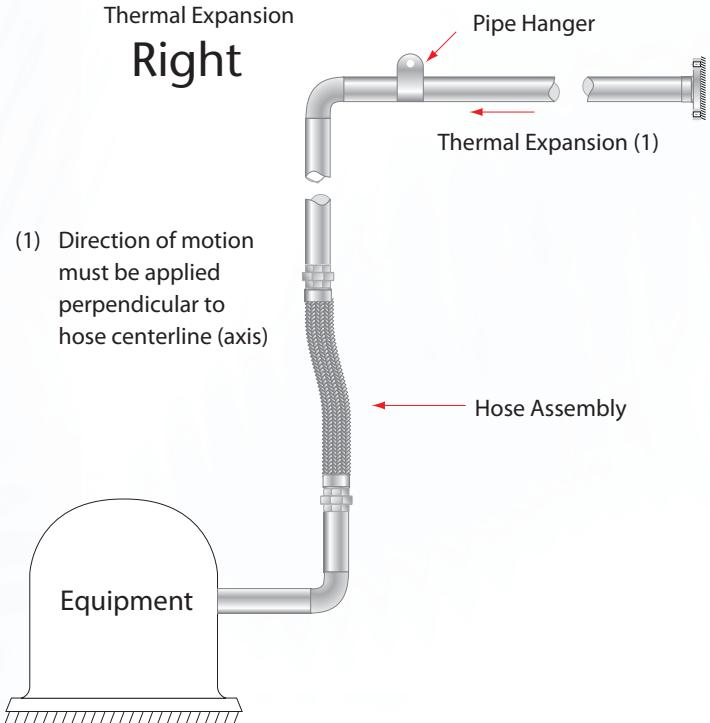

- 2) The pipe must be anchored at each change of direction where a flexible metal hose is employed to prevent torsional stress.

Typical examples of correct and incorrect guiding are shown below.

Right

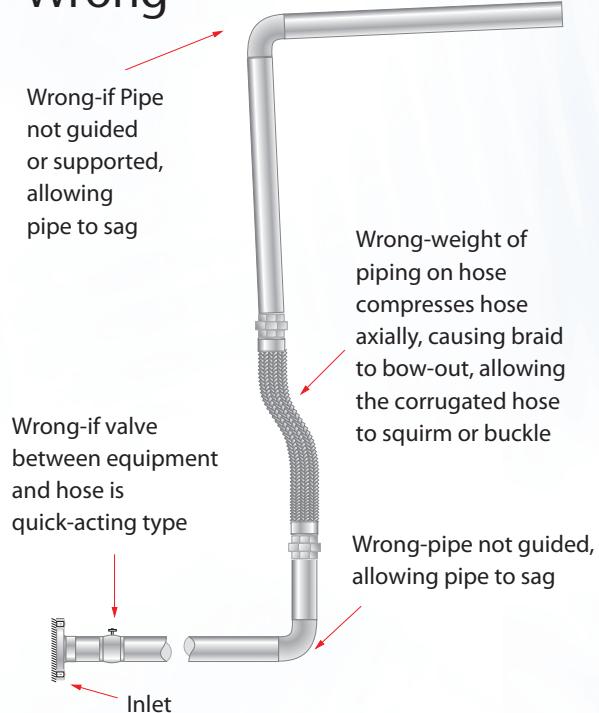

Right

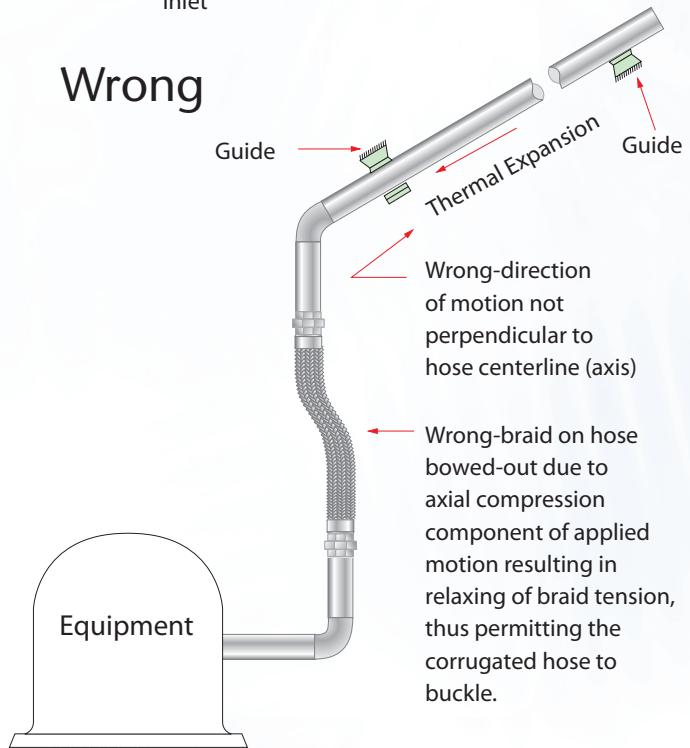

(1) Direction of motion must be applied perpendicular to hose centerline (axis)

[LABORATORY CORROSION CHART]

These charts contain recommendations based on published corrosion data for valid laboratory or field tests. However, this data should be used only as a guide and is not a guarantee of actual service performance. It is recommended that the user test the combination before connecting the product to any application. For additional recommendations contact Senior Flexonics.

FLEXIBLE METAL PUMP CONNECTORS

WHY USE SENIOR FLEXONICS PUMP CONNECTORS?

The basic function of pump connectors is to provide piping systems with the flexibility needed to absorb noise and vibration, compensate for thermal growth, or permit motion of other piping elements.

Senior Flexonics pump connectors are a perfect match of style, wall thickness and design to minimize the forces and stress within piping systems. These pump connectors are factory engineered, manufactured and tested to effectively minimize the stress on pump and compressor housings and to isolate vibrations transmitted by mechanical equipment. Senior Flexonics can help you comply with noise level requirements by reducing pipe vibration throughout a structure.

FEATURES:

- ABSORBS THERMAL GROWTH MOTION**
Excellent protection to adjacent piping and equipment.
- COMPENSATES FOR MISALIGNMENT**
Reduces stresses.
- CONTROLS VIBRATION**
Normal mechanical equipment vibrations are reduced at the connector.
- REDUCES NOISE**
High pipe vibration noise is greatly reduced . . . often eliminated.
- ALL METAL CONSTRUCTION**
Eliminates shelf life problems and allows operation at elevated temperature.

• For use in copper piping systems

FLEXIBLE METAL PUMP CONNECTORS

DESIGN CHARACTERISTICS

BSN Connectors: Stainless Steel hose and braid, SCH 40 carbon steel NPT nipples.

BRC Connectors: Bronze hose and braid, copper female sweat ends. For use in copper piping systems.

BSFS Connectors: Stainless Steel hose and braid, 150lb. raised face forged steel Slip On flanges.

TCS-R Connectors: Multi-Ply Stainless Steel bellows, carbon steel 150lb. flat faced flanges.

NOTE

- Model TCS-R rated for 1" compression, 3/8" extension, 1/8" -5/16" lateral and pump vibration. (Depending on size)
- Movements shown are non-concurrent
- Larger sizes available upon request.

C.S.A CERTIFIED ASSEMBLIES

SERIES "FLT" STAINLESS STEEL METAL HOSE ASSEMBLIES FOR NATURAL GAS AND PROPANE TRANSFER

- Sizes 1/4" ID through 6" ID with fittings welded each end
- Single Braided to 2-1/2" ID, Double-Braided from 3" through 6" ID
- CSA labels permanently attached
- Hoses 100% tested per CSA standard for minimum of 1 minute
- Supplied with carbon steel or stainless steel end fittings

PRESSURE RANGE

- Max WP 350 PSIG (* 275 PSIG for Class 150# Flanges) - 1/4" through 2" ID
- Max WP 250 PSIG (All end fitting types) - 2-1/2" and 3" ID
- Max WP 200 PSIG (All end fitting types) - 4" through 6" ID

STANDARD HOSE ASSEMBLY

PART NUMBER DESIGNATION

FLT-025-AA-030.5-350

NOMINAL HOSE AND FITTING SIZE END FITTING TYPE HOSE LENGTH IN INCHES OPERATING PRESSURE IN PSIG

EXAMPLE: The above part number designation is for a 1/4" size hose with a SCH 80 Steel Male Nipple on each end, 30.5" long, working at an operating pressure of 350 PSIG.

| Series | Size | Max. Working Pressure PSIG (Class 300/150) | Overall Length (Inches) | End Fitting Type (Options) |

NOTE: Add suffix S04 or S06 to part designation for T304 or T316 fittings. Carbon steel fittings are supplied with standard part designation.

—[MONEL® CHLORINE ASSEMBLIES]—

SERIES "CMA" MONEL® 400 BRAIDED HOSE ASSEMBLIES FOR CHLORINE TRANSFER

- Sizes 1/2" through 2" ID with fittings welded each end
- Manufactured and tested in accordance with the chlorine institute recommendations per pamphlet 6 - appendix A. latest edition
- Minimum Design Pressure 375 PSIG @ 70 °F.
- Minimum burst pressure 1876 PSIG. Pamphlet 6 - edition 16
- Factory assembled and gas pressure tested to 750 PSIG
- Cleaned and capped prior to shipping
- Permanently labeled with SS Tag
- Standard Monel Hex Male NPT pipe nipple end fittings or optional 300 LB Forged Steel Lap Joint flange on Sch 80 Type "A" Stub End

STANDARD HOSE ASSEMBLY

EXAMPLE: The above part number designation is for a 1/2" size hose with a Sch 80 Monel Hex Male Nipple on each end, 72" long.

| Series | Size | End Fitting Type | Overall Length (Inches) |
|--------|--------------|---|----------------------------|
| CMA | 050 (1/2") | 1 - Sch 80 Monel Male NPT with Steel Wrench Hex | Overall Length as Required |
| CMA | 075 (3/4") | 2 - 300 LB FS Lap Joint Flange | |
| CMA | 100 (1") | | |
| CMA | 125 (1-1/4") | | |
| CMA | 150 (1-1/2") | | |
| CMA | 200 (2") | | |

SPECIALTY ASSEMBLIES

JACKETED ASSEMBLY

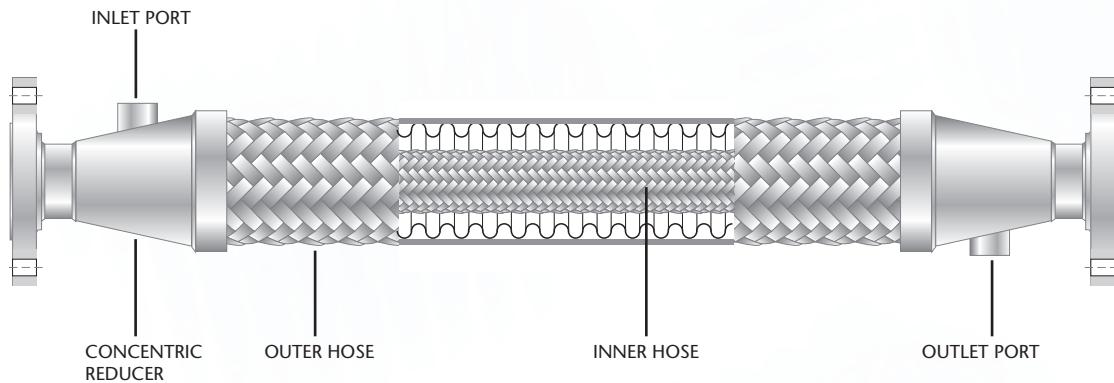

JACKETED ASSEMBLIES ARE USED IN THE FOLLOWING APPLICATIONS:

HEATED TRANSFER HOSE

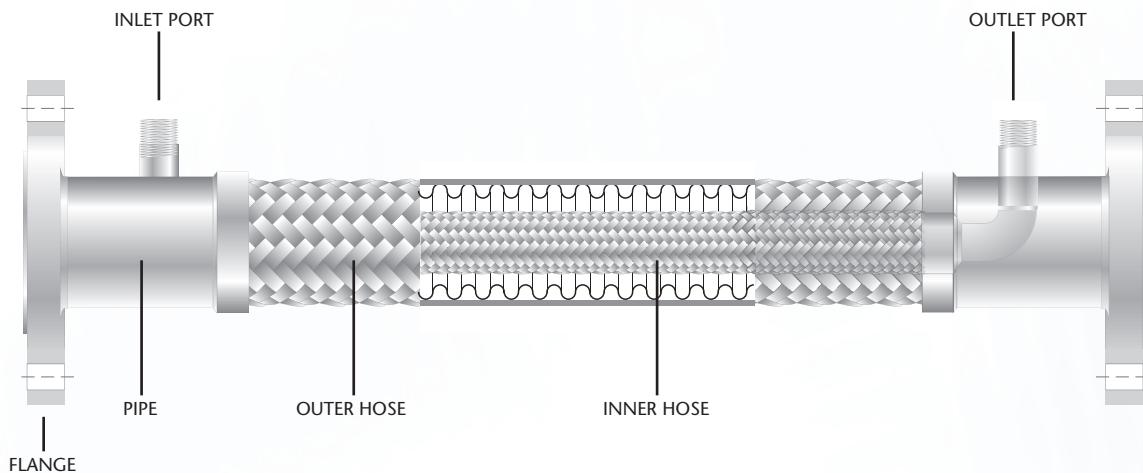

- For media that must be at elevated temperatures in order to flow readily, steam or hot oil is circulated through the outer hose which heats the inner hose conveying the media.

VACUUM INSULATED HOSE

- For vacuum jacketed (V) cryogenic transfer lines. A vacuum is drawn between the inner and outer hose to insulate the inner hose.

TRACED ASSEMBLY

Media (steam or hot oil) conveyed through the inner hose in order to increase temperature of the media being conveyed through the outer hose assembly

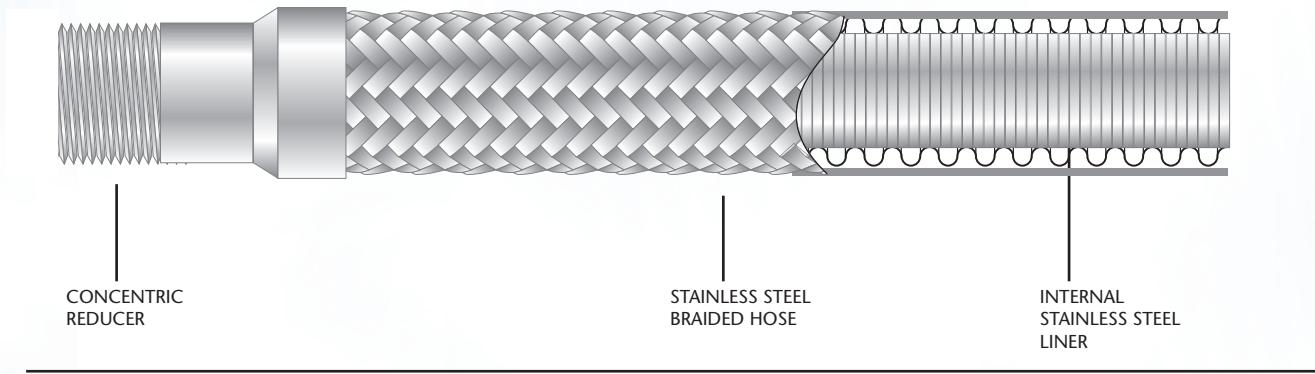

—[SPECIALTY ASSEMBLIES]—

LINED ASSEMBLY

LINED ASSEMBLIES ARE USED IN THE FOLLOWING APPLICATIONS:

Assemblies can be furnished with a stainless steel interlocked metal hose installed inside the corrugated hose. This liner reduces turbulence when high product velocity is a concern.

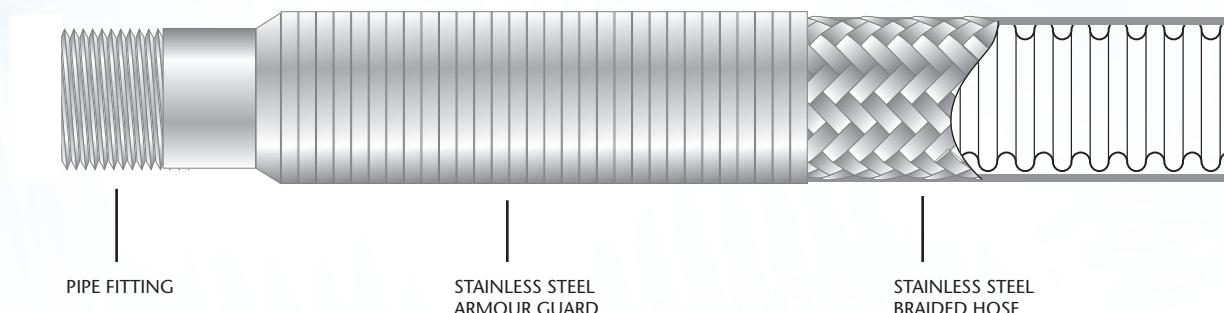

Also used to protect the inside of corrugated hose from abrasive media.

GUARDED ASSEMBLY

GUARDED ASSEMBLIES ARE USED IN THE FOLLOWING APPLICATIONS:

Assemblies can be furnished with a stainless steel interlocked metal hose covering some or all of the outside of the corrugated hose. This guard helps to protect the hose assembly from damage and over bending.

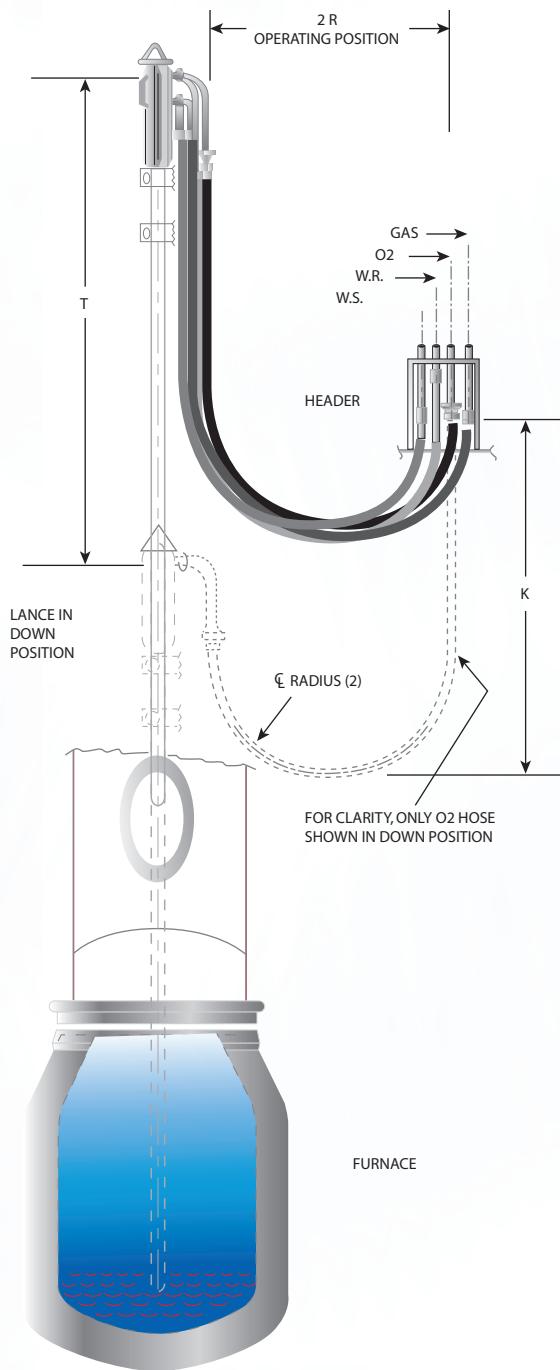

ENGINEERED METAL HOSE ASSEMBLY

OXYGEN LANCE HOSES

Senior Flexonics has for decades manufactured and supplied all metal corrugated stainless steel hoses for handling oxygen. Our lance hoses have provided documented operating performance improvements, and are a practical answer to the many uncertainties of rubber or packed interlocked lance hoses.

Senior Flexonics all metal construction is safe, non-combustible, pressure tight, and wear resistant.

TYPICAL OXYGEN LANCE INSTALLATION

LENGTH DETERMINATION FORMULA

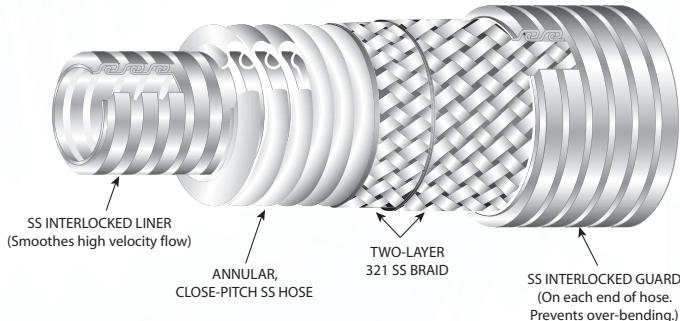

$$L = 4R + T/2$$

$$K = 1.43R + T/2$$

Notation:

K = Loop Length (Inches)
L = Hose Live Length (Inches)
R = Center Bend Radius (Inches)
T = Total Travel (Inches)

*Over-all Hose Assembly Length = L + Total Fittings Length Both Ends.
Water and or natural gas lines follow the same loop and also available from Senior Flexonics

8 GOOD REASONS TO SPECIFY SENIOR FLEXONICS S.S. LANCE HOSE

- 100% Metal... Withstands temperatures up to 1500°F without deterioration, superior fire, flame, and char-proof characteristics.
- Complete Oxygen Compatibility- assures flow of pure oxygen
- Zero Leakage- saves oxygen, adds extra safety dimension
- More flexible than rubber- longer cycle life.
- Weighs less than rubber- easier handling, easier to install.
- No age hardening, no shelf life limitations.
- Fittings welded to hose- optimum protection against breakage
- Double Braiding, Double Hose Layer- optimum operation, safety and performance.

METAL HOSES FOR ALL STEEL MAKING APPLICATIONS

Senior Flexonics has available, metal hose products for most steel making applications. Our developmental approach is to research a problem area and design a product to solve the specific need. This technique has been used for over 100 years and has enabled us to develop an unsurpassed line of standard steel mill products. Our applications engineering expertise can help you with the design of any new product.

[INTERLOCKED HOSE]

SERIES RT-6 LIGHTWEIGHT INTERLOCK STAINLESS STEEL HOSE

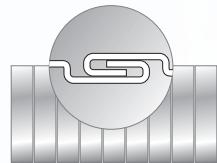

Assemblies can be furnished with a stainless steel interlocked metal hose installed inside the corrugated hose.

Construction: Fully Interlocked. Galvanized Steel, Stainless Steel

Size Range: 1/2" through 12"

Metal Thickness: .010"

Application: Auto heater tubing, ventilation ducting, automotive exhaust, moderate suction lines, dust collecting, refrigeration tubing armour, air blower ducting, wiring conduit, carburetor air intake.

[INTERLOCKED HOSE]

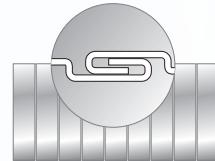

SERIES RT-8 HEAVYWEIGHT INTERLOCK STAINLESS STEEL HOSE

Construction: Fully Interlocked. Galvanized Steel, Stainless Steel

Size Range: 1/2" through 12"

Metal Thickness: .016" to .018"

Application: Truck exhaust, ventilating ducting, tractor exhaust, suction hose, voice tubing, conveying sawdust and grain, engine exhaust, air intake, protective armour or guard.
